User Guide

Start the app

1. Start the backend: `uvicorn backend.main:app --reload --reload-dir backend`
2. Start Ollama if you want meal plans.
3. Start the frontend: `cd frontend` then `npm run dev`
4. Open http://localhost:5173/

Food Recognition

1. Open Food Recognition in the sidebar.
2. Upload a JPG, PNG or WEBP photo.
3. Optional: hold the record button to add voice, or type a description or goal.
4. Click Analyze Meal.
5. Read the dish, confidence, calories range, macros and health score. These are estimates.

Meal Planner

1. Open Meal Planner.
2. Fill in age, gender, height, weight and activity level.
3. Choose goal, diet type and cuisine. Enter allergies, medical conditions and recent food.
4. Click Generate AI Plan.

Troubleshooting

Problem	Fix
Backend shows `name 'app' is not defined`	Define `app = FastAPI()` before any `app.include_router`
Meal Planner shows "Ollama error 500"	Check `ollama list`, make sure the model name matches, and use a smaller model if RAM is low
Wrong dish predicted	The dish may not be in the trained classes
